

Google Pixel Display Replacement

Replace a cracked, broken, or otherwise dysfunctional screen on a Google Pixel.

Written By: Taylor Dixon

INTRODUCTION

This repair guide was authored by the iFixit staff and hasn't been endorsed by Google. Learn more about our repair guides [here](#).

Use this guide to remove your Pixel's screen—either to replace it, or get it out of the way so you can make repairs to other components.

Warning: Because of the strong adhesive securing the display, minimal clearance for inserting your tools, and high heat required, there's a good chance of accidentally damaging the display during this procedure. If you're replacing a broken display, then you don't have to worry—but for all other repairs, work very carefully, and be prepared to replace the display afterward.

TOOLS:

- [Spudger](#) (1)
- [T5 Torx Screwdriver](#) (1)
- [Tweezers](#) (1)
- [iOpener](#) (1)
- [Suction Handle](#) (1)
- [iFixit Opening Picks \(Set of 6\)](#) (1)

PARTS:

- [Google Pixel Screen](#) (1)
- [Google Pixel Display Adhesive](#) (1)

Step 1 — Display

- Turn off the device.
- [Prepare an iOpener](#) to heat the edges of the display and soften the adhesive underneath. Alternatively, you may use a heat gun or a hair dryer.
- ⓘ The surfaces near the speaker and microphone (top and bottom respectively) have larger adhesive sections. These areas may require slightly longer heat exposure. The display should be heated until it's slightly too hot to touch, for roughly two minutes.

Step 2

ⓘ In the following steps, you will separate the display panel by slicing through the adhesive bonding the display to the Pixel's chassis.

- For reference, the back of the display panel is shown at left. Note the narrow clearance between the side of the display unit and the OLED panel. (The bezels indicate this spacing on the front.)

⚠ Inserting an opening tool deeper than 1.5 mm into the sides of the device, or 9 mm into the top and bottom can permanently damage the display.

Step 3

- Use a [suction handle](#) to pull up on the display and create a slight gap between the display and the phone's chassis.
- ⓘ If your display is cracked, [cover it with packing tape](#) to help the suction cup adhere and prevent glass shards from popping loose.
- You may need to apply more heat if this doesn't come up. Don't be impatient, **this will take time**. Once you can gently insert a tool in the gap, move on to the next step.

Step 4

- Insert an opening pick or a playing card into the gap between the chassis and the display assembly.
- Begin to slide the opening pick around the edge of the display, cutting through the adhesive that secures it.

⚠ Do not try to lift or pry the screen off with the pick. Simply slide it around to detach the adhesive.

ⓘ The display panel is extremely fragile. If you plan to re-use your display, take care to insert your tool only as far as necessary to separate the adhesive. Inserting the tool any further can damage the OLED panel under the glass.

Step 5

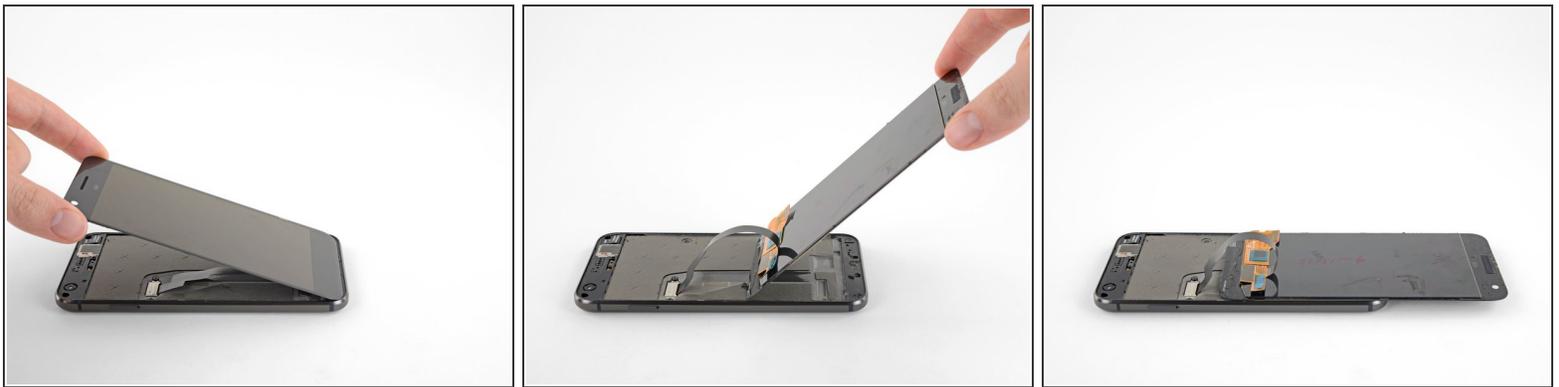

- Continue carefully separating the adhesive around the rest of the device.

⚠ There's a mesh covering the earpiece speaker on the top edge of the screen. If you don't have a replacement mesh, take care not to damage or lose this component.

⚠ Take extra care with the side bezels, which are only 1.5 mm deep.

Step 6

- With the adhesive cut, slowly lift the display up from the top (the side with the speaker-grille cutout), carefully flip it over vertically toward the bottom of the device, and rest it on its face, as shown.
- ⓘ Don't forget there's sticky adhesive everywhere, so consider resting an [opening pick](#) between the screen and display, to avoid spreading the gunk!

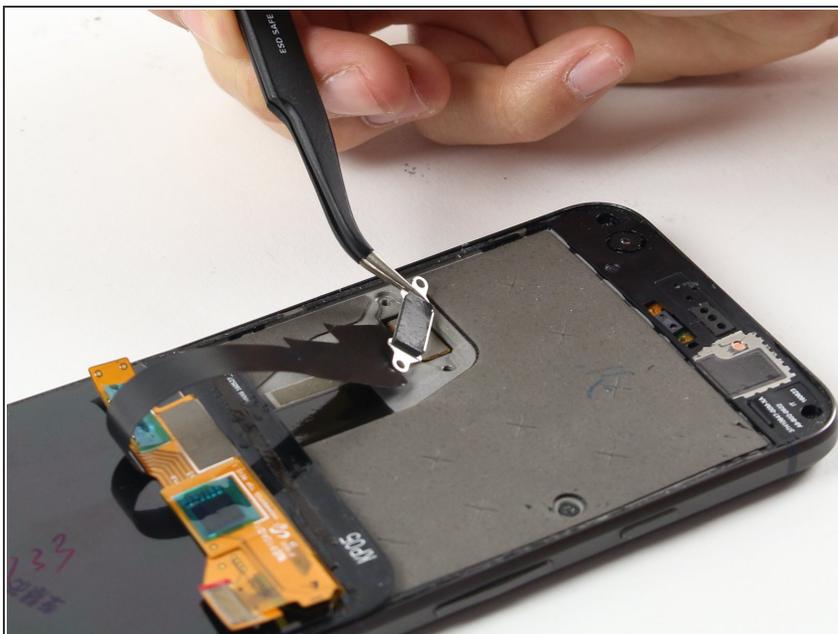

⚠ Do not attempt to completely remove the display yet, as it is still connected by a fragile ribbon cable. Be careful to not to strain the cable while positioning the display.

Step 7

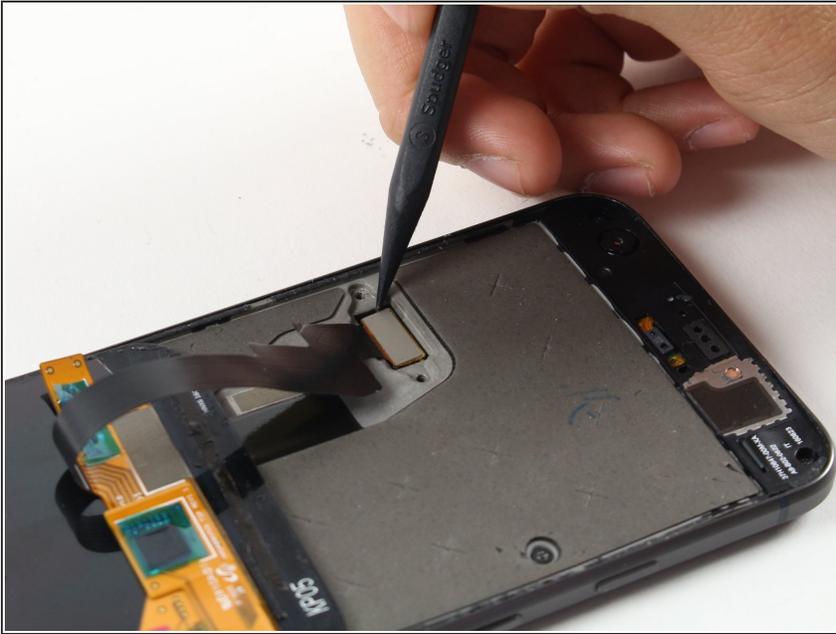

- Use a T5 Torx driver to remove the two black 3.5 mm T5 screws securing the display cable connector bracket.
- ⓘ Throughout this repair, [keep track of each screw](#) and make sure it goes back exactly where it came from.

Step 8

- Use tweezers to remove the bracket that holds the display connector in place.
- This is just a piece of metal, and should come up very easily. (The cable is removed in the next step.)

Step 9

- Use a spudger to pry up the [display cable connector](#), freeing the display.
- ☑ On reassembly, gently snap one side in, then the other.
- ⚠ Do not force this type of connector into place, as damage can occur. (You will need to feel a light snap, but force beyond this will permanently damage your connector.)

Step 10

- Remove the display.
- ☑ Some replacement displays do not come with an [earpiece speaker grille](#). If your replacement screen doesn't have one, be sure to transfer the grille from your old display to the new one.
- ☑ During reassembly, pause here to test the functionality of your new part and [replace the display adhesive](#).
- ☑ During the boot-up process after reassembly, the screen will go through a calibration sequence. Do not touch the screen during this process, as it could result in improper touch calibration and create touch issues.

Compare your new replacement part to the original part—you may need to transfer remaining components or remove adhesive backings from the new part before installing.

To reassemble your device, follow the above steps in reverse order.

Take your e-waste to an [R2 or e-Stewards certified recycler](#).
